

# Additional Netting Installation Methods <sup>AN</sup>

## Different ways to get the desired results - No Birds!

Nixalite® recommends installing all bird netting with our netting hardware and accessories. We offer these items because they can fasten netting to nearly any surface and they are specifically designed to do the job. However, this is **not the only way** to install netting. The details below provides examples of 'additional methods' that can be used to install bird netting. Before installing, make sure that the method you use will achieve the desired results - no gaps, tears, wrinkles or excessive sag in the netting fabric. If you have any questions, contact Nixalite®.

### Staple, Roll, Install

For flat surfaces, staple the edge of the bird netting to a 1x2 (wood) then roll the 1x2 in the netting 2 or 3 times. Apply a bead of latex based sealer\* to the back of the 1x2 and fasten it to the surface.

Allow **at least** an extra foot of netting on all sides of the net so each side can be stapled, rolled and installed.

#### Staple..

#### Roll..

#### Install.

Pre-drill 1x2 for faster installation. Drawings are examples - your installation may be different.

**\*Do not use solvent based sealer/adhesive. Solvent can melt some poly based netting on contact.**

### Netting Frames

A simple frame can be used to secure bird netting. If using wood, follow the 'staple, roll, install' steps shown above. Other framing materials can be substituted for wood.

Frames can be used for flat and straight sided areas. For areas that have curves and many corners, use Nixalite's net hardware.

#### Eaves & Overhangs

#### Structural Openings

#### Small Enclosures

Drawings are examples - your installation may be different. Questions? Contact Nixalite

### Wood On Steel

Use for flat steel surfaces only. Wood 'nailers' can be fastened to structural steel beams to make netting installations on structural steel easier and faster.

Boards can be securely fastened to steel surfaces using less hardware than if the netting were fastened directly to the steel surface.

#### Fasten to steel

#### Sandwich Netting

#### Vertical Beams

Drawings are examples - your installation may be different. Questions? Contact Nixalite

# Bird Netting Enclosure Examples

The drawings below are **examples**. Your installation may be different. Questions? Call ABC/Nixalite.

## Eaves & Overhangs

Closes off sheltered areas under eaves and overhangs. Clean the area thoroughly. Enclose the area from the edge of the roof down to the wall. The wider the overhang, the farther down the wall the netting must run.

Using the proper fasteners, net off the open ends and close up all netting seams.

### Plan Netting Path

### Install Netting

### Seal Ends & Seams

## Dormers

Protects the sheltered areas where a dormer roof overhangs the main roof.

Thoroughly clean the area. Install the netting in 2 pieces as shown. Use the fastening method that best suits the installation surfaces. Close seam at outside corner.

Protect both sides of dormer.

### Plan Netting Path

### Install Side Netting

### Seal Front & Seam

## Awnings

Keep birds out from under awnings, canopies and covered walkways.

Clean all areas thoroughly. Determine the best route for the bird netting.

Use fastening system that allows for access behind netting and best suits the installation surfaces.

### Plan Netting Path

### Install Netting

### Large Awnings

## Net Cover & Curtain

Cover vertical walls to keep birds off of complex surfaces. If birds can get to both sides, cover both sides with netting.

Curtain installations help keep birds from flying through openings where a solid barrier is not practical. Use the draw top or fixed top methods shown.

### Wall Cover Netting

### Curtain - Draw Top

### Curtain - Fixed Top
