

PiGNX[®] Poison Bait Replacement Protocol

Simple - Safe - Effective - Profitable

PiGNX is a contact repellent - birds that eat the product are not affected by ingestion as evidenced by wild birds that routinely feed on hot chili's in the field. In order for the birds to feel the full effect of the capsaicin on their skin they need to step in it. Placing PiGNX on top of the feed is not designed to get the birds to eat it. It is designed to get the birds to step in the product.

PiGNX will not harm the birds in any way. It will simply cause them to leave the area. New birds will return so reapplication will be required on a regular basis. This is a true recurring revenue opportunity.

1. **Apply the bird's favorite food to a feeding station or directly on the ground or roof.**

2. **Apply PiGNX Bio Repellent on top of the food source. The amount required will depend on the flock size. Once the product has been trampled into the food source reapplication will be required. Use a minimum of 1 tube per placement. The Thicker – the Better!**

3. **Do not rely on the product to work for more than a week or two as PiGNX will be absorbed by dried grains like whole corn. The grains will pull the mineral oil from the product leaving a gummy-worm type residue. Fresh PiGNX will need to be applied regularly.**

No Pre-Baiting Required – No more sick or dying birds – No more required Cleanup

ALWAYS READ THE PRODUCT LABEL BEFORE APPLICATION!!
